

Open Source vs Proprietary Software: Group Discussion

Lori Carter

2021-07-21

Recall that the definition of Accessibility from the Oxford Dictionary is threefold:

- 1.1 The quality of being easy to obtain or use.
- 1.2 The quality of being easily understood or appreciated.
- 1.3 The quality of being easily reached, entered, or used by people who have a disability.

Using what you learned in your reading about the benefits of open source software and of proprietary software, consider with your group the pros and cons of open source software with regard to each of the sub-definitions of accessibility. Be prepared to discuss your answers with the class.

1. Is open source software easy to obtain and use? In what ways is it easy, and in what ways might it be hard?
2. Is open source software easily understood? What is required for software to be understandable? What do you know about open source software that might inform your answer to this?
3. Is open source software easy to access by people with disabilities? Be sure to think about all of the different disabilities that you discussed with your class.
4. Would any of these be more or less likely to be a problem with open-source vs. proprietary software? Why?

Virtue Ethics

You have explored the pros and cons of open source and proprietary software. One of the ways to decide the best approach (proprietary or open source) for creating software to support accessibility would be to use the virtue ethics framework. Recall that this framework looks at which virtues are upheld with a given decision, and which are violated. Let

integrated ethics LABS

us consider which of the virtues might be violated by the proprietary approach and by the open source approach.

5. Put a P by the virtues (listed below) violated by a purely proprietary approach, and an O by virtues that might be violated by the purely open source approach.

You probably discovered that both approaches violate one or more virtues. This is not straightforward! {{% virtues-list %}}

Consequentialist Framework

Let's turn to another framework: The consequentialist framework. Consequentialism suggests that the most ethical approach is the one that has the best consequences. For example, it may provide the best outcome for the most people.

6. Make a list below of the stakeholders involved in producing/using software with an eye for all kinds of accessibility (economic, physical, mental).
7. Next to the stakeholder, make a list of their needs. The list is started for you as an example, but there are other stakeholders and other needs.

Stakeholder	Need or contribution	Software creators (designers, developers, managers, maintenance etc.)
		Provide for themselves and/or their families
		Understand the requirements of the application. What is its goal, who are its users, and what can realistically be implemented
		Clear specifications for writing the code
		Coordinate the efforts of the developers
		General users
		Software to perform a task at a reasonable cost
		Software that is easy to install
		IT professionals
		Users with disabilities
		Software distributors and system trainers

8. You probably noticed that neither the open source approach or the proprietary approach meet all of the needs of the stakeholders. Can you create another approach that would do a better job?
